It often happens that the question that the user asks you is not understandable, unusual or complex. So the question arises, how to get an answer to such a question during an active conversation? In this guide you can find tips on how to find the answers yourself and faster.

## Basic mindset answers to complex questions:

### **Provide the user with a lot of empathy**

Often, complex user questions are difficult because the user is in a difficult emotional state and a difficult life situation. It's important to keep in mind that your call should first and foremost be a safe place for the user to feel supported and understood. Don't spare warm words at the beginning, so you can put the user at ease. Show them support with your tone of voice, the words you say, and watch how you present empathy - it should sound sincere on your part, not repetitive and typical.

### **Look for the main pain in the user's request and give a reading based on this**

Don't rush into details and secondary questions before answering the main question. This is the red line that you can rely on when you build your conversation further.

### **Look for specific pain that is hidden behind more abstract issues**

If the user's query is more like a retelling of a life situation (does not contain a direct question, or has abstract questions), then join the user empathically, put yourself in a similar situation, and think about what you would want to hear in such a situation. Be proactive, seize the initiative, and provide answers before the user has any questions. The user's pain may not be immediately clear from their first story. Don't be afraid to ask questions to understand the user better.

The user does not always ask exactly what he really cares about.

If the user **has many specific questions**, then the method from **less to more** (inductive) should be used to identify the underlying pain. For example, if a user asks specific questions about his partner, we can draw a general conclusion that the main pain of the user is the fear of divorce, the fear of loneliness, the fear of betrayal.

If the user's questions, on the contrary, are too **general and abstract**, then in this case we use the deductive method **from larger to smaller**, and look for more specific questions that the user may worry about. For example, the question "when will I die?" may be anxiety for a particular disease, fear of not having time to finish some business, fear of leaving loved ones alone. Understanding these things will help you give a more relevant answer and develop your dialogue further.

### **Don't make clear predictions if the user's question is too vague or unclear**

Until you are sure that you understand the user's pain and the actual essence of the question, it is better to refrain from giving unnecessary details when answering. Let your answers also be more general until you get more details from the user.

### **The answers should be positive**

During the first readings, you should set the user in a positive mood, give some positive predictions supported by your tools. Your reading should be inspirational and make the user want to learn more, and you should also use a pleasant tone of voice. Your voice shouldn't sound indifferent or cold, show positive emotions.

### **Don't be afraid to use alternative tools**

Tarot and astrology are usually the main tools in the arsenal of our experts, but do not underestimate other available tools for reading. For example, the

question "Where?" can be answered by a pendulum, and a magic ball can be used to describe a person's appearance. Runes can help you with answers to more abstract messages.

## **Look for more information in the knowledge base or on Google**

It is unlikely that a user will make a request that no one has ever heard of. There can be many interesting articles on the Internet. So do not hesitate to explore new tools for yourself and become an expert in new fields!

If you have difficulty with slang that you don't understand, you can use UrbanDictionary to decipher it. If you are unable to understand the slang word used by the user, it is better to ask what they meant, thank them, and provide an answer.

## **What are the most difficult questions from users?**

Difficult questions from users can be either a request to use tools that the expert does not understand (fate matrix, Vedic astrology, etc.) or complex questions. It's worth analyzing a few examples of such requests to better understand the mindset of answering them.

### **Requesting to use a complex tool**

If a user approaches you with a request to use a tool you don't know, you should kindly mention to them that this tool is not your expertise though you can provide them with an answer by the usage of another tool. And start doing the reading using your tool. Do not leave the user with silence as they might leave your call as well!

Do not show the user that you are not sure what you are doing and never refuse them. If you feel that it is difficult for you to continue reading on the tool that the user has asked for, then after giving the answer, gently offer to look at it on a tool that you know and that will be comfortable for the user as well.

### **User's question concerns death**

The first thing to do is to reassure the user that their life is valuable and they have influence over what happens to them. Your reading should be positive,

and your positivity should match your tone of voice. You don't have to tell the user specific dates or deadlines right away. You can reassure the user with a more general reading.

The main point is to provide a positive reading, say it all with a pleasant tone of voice, and direct your conversation to identify the reason why the user is thinking about such issues. Reveal the user's most important pain point and continue the audio call.

Questions about death often have a deeper problem behind them. Such users often want to attract attention and receive sympathy. Give them this!

### **User is in a difficult life situation**

Such requests require a lot of empathy and positive readings from you.

Even if the user doesn't ask a specific question, you can almost always tell from the user's request and tone of voice what their pain is. Grab hold of this thread and gradually lead the user to a more constructive dialog. Describe positive future scenarios in your readings, show empathy, and watch your tone of voice in such a conversation!

Since your communication will take place over an audio call, make the user feel that you are actively listening to them, provide reactions to their sentences, and do not interrupt.

In general, you will hear from the conversation what condition the user is in, and it will be easier to determine whether it is a serious condition by the tone of her conversation. That's why it's very important to follow how the user tells you about a particular problem in their life.

### **The user is faced with a difficult choice**

We don't make the choice for the user, we can only guide them and talk about the options that are available. Until the user gives you enough details, don't jump to conclusions. Don't push the user to make a decision that could be risky for them. Show empathy and tell them they deserve the best. Find out more details before giving specific advice.

Users with such requests often want an expert to take responsibility for their choices, but the final decision should always be up to the user. You can do a reading and say which scenario can have what consequences. Find the cause of doubt and develop the reading in that direction.
